Project Topic

I am interested in using augmented reality to create a personal organization app. I want it to be a more efficient way of categorizing and prioritizing tasks while catering to UC Davis courses. It will use the camera to take a snapshot of something that needs to get done, with an option to also type it in. It should be able to sync to a calendar and have an innovative and responsive interface that easily lets the user move items to prioritize and check them off by quickly swiping in a pre-determined direction.
